

SACRIFICIAL ANODE 13 lb. RADIATOR CAP **Z17704**

- Regulates system pressure
- Can prevent costly engine damage
- Combats cooling system electrolysis damage
- Prolongs engine and cooling system life

Electrolysis is a chemical reaction produced by current that can gradually destroy metal components and ruin your engine and cooling system. Let the patented Sacrificial Anode Radiator Cap absorb the destructive electrolysis - instead of your expensive engine and cooling system parts!

NEVER REMOVE THE RADIATOR CAP WHEN HOT

All Sacrificial Anode Radiator Caps should be changed every 24,000 to 36,000 miles, or when the anode is eaten away. Inspect your Sacrificial Anode Radiator Cap monthly.

A radiator cap that saves you money!

Patented Sacrificial Anode Radiator Cap

Adjustable 3 1/2" to 6"
spring to fit
all radiators

Electrolysis:
Positive and
negative charges
are attracted to
the sacrificial
anode and not to your
engine or your cooling system.

Magnesium
anode with
protective
shield.

Check anode
monthly

Without Sacrificial Anode Radiator Cap, the thermostat housing cover shows major deterioration after 60,000 miles.

After 60,000 miles with the Sacrificial Anode Radiator Cap patented technology the effects of electrolysis that can ultimately destroy the entire cooling system are dramatically reduced.
